```

```
FUNCTION: Involved in neurodegeneration.
SUBUNIT: Interacts with SH3P12, FSMC1 and CRX.
SUBCELLULAR LOCATION: Nuclear. In addition to a diffuse distribution throughout the nucleus, it is associated with the nuclear matrix and the nucleolus. Isoform b is cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. Note-No experimental confirmation available;
Note-No experimental confirmation available;
TISSUE SPECIFICITY: Expressed at highest levels in cerebellum, expressed mainly in granule cells a to a lesser extent, in Purkinje cells.
DBVELOPMENTAL STAGE: Low levels are found at postnatal day 4.
Levels increase from postnatal day 7 to postnatal day 17. Levelecrease and remain low in the adult.
SIMILARITY: Belongs to the AND32 family.
SIMILARITY: Contains 4 leucine-rich (LRR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heterodontus francisci (Horn shark).

Biochem. J. 324:329-339(1997).
-!- FUNCTION: Control of topological states of DNA by transient breakes and subsequent rejoining of DNA strands. Topoisomere makes double-strand breaks.
-!- CATALYTIC ACTIVITY: ATF-dependent breakage, passage and rejoi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FAS2 YEAST STANDARD; PRT; 1887 AA.

Fatty acid synthase subunit alpha (EC 2.3.1.86) [Includes: Acylcarier; 3-oxoacyl-[acyl-carrier protein] reductase (EC 1.1.1.100 (Beta-ketoacyl reductase); 3-oxoacyl-[acyl-carrier protein] synth (EC 2.3.1.41) (Beta-ketoacyl synthase)].
                                                                                                                            -!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear.
-!- MISCELLANEOUS: Enkaryotic topoisomerase I and II can relax bc negative and positive supercoils, whereas prokaryotic enzymes relax only negative supercoils.
-!- SIMILARITY: Belongs to the type II topoisomerase family.
                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Subunit contains domains for: acyl carrier protein, [acyl-carrier protein] reductase, and 3-oxoacyl-[acyl-cen] synthase. This subunit coordinates the binding beta subunits to the enzyme complex.

ACTIVITY: Acetyl-CoA + N malonyl-CoA + 2N NADPH = a acyl-CoA + N CO(2) + 42N NADPH +).

ACTIVITY: Acyl-[acyl-carrier protein] + malonyl-[acyl-carrier protein] + malonyl-[acyl-carrier protein] + co(2) + docyl-[acyl-carrier protein] + Co(2) + docyl-carrier protein]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACTIVITY: (3R)-3-hydroxyacyl-[acyl-carrier protein]

"Acidic phosphoprotein complex of the 60S ribosomal subunit of maisedling roots. Components and changes in response to flooding.";

Plant Physiol. 114:1293-1305(1997).

-!-FUNCTION: Plays an important role in the elongation step of protein synthesis (By similarity).

-!-SUBUNIT: Pl and P. exist as dimers at the large ribosomal subu

    -!- PTM: Phosphorylated.
    -!- PTM: The N-terminus is blocked.
    -!- SIMILARITY: Belongs to the L12P family of ribosomal proteins.

                                                                                                                                                                                                                                                                                                                                                                         STRAIN=cv.                                                                                                                                                                                                                                                                              Participates in both the initiation and recycling phases iption. In the presence of the delta subunit, RNAP in increased specificity of transcription, a decreased for nucleic acids, and an increased efficiency of RNA because of enhanced recycling (By similarity). Why is composed of a core of 2 alpha, a beta and a beta'. The core is associated with a delta subunit and one of eggma factors (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   terisse J., Courtois G.,

May have a role in the differentiation of molars sors. Binds to a regulatory medule of the NCAM promoter. AR LOCATION: Nolear (Probable).

PECIFICITY: Expressed predominantly in the facial, developing stomach, and proximal limbs.

NTAL STAGE: Expressed on areas of the first and second arches, before any apparent cellular or morphologic lation. Later in development, all expressing tissue in on, including the mesenchyme underlying the molar tooth and the stroma of the submandibular gland, appear to be and the stroma of the submandibular gland, appear to be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Swiss Institute of Bioinformatics and the EMBL outstation Bioinformatics Institute. By day 16.5, except the developing molars are BARX1-negative. In BARX1 marks the area of the future stomach in the gut at embryonic day 9.5, and is present in the ral wall of the stomach until embryonic day 16.5. Y: Belongs to the BAR homeobox family.

In directly involved in specifying identity of individual neuron Pair-rule protein required for segmentation; involved in transforming the broad, spatial, aperiodic expression pattern the gap genes into a system of precise periodic expression patterns of the pair-rule and segmentary polarity genes.
Frasch M., Hoey T., Rushlow C., Doyle H., Levine M.; "Characterization and localization of the even-skipped protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. -!- FUNCTION: The Li3 protein is a component of the large subunit cytoplasmic ribosomes.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- ALTERNATIVE PRODUCTS: Lewis S.E., $\boldsymbol{\mu}$ "Annotation of the Drosophila melanogaster euchromatic genome: a Event=Alternative splicing, Named isoforms=3, Comment=Experimental confirmation may be lacking for some Name=A; Synonyms=B, E; IsoId=016797-1; Sequence=Displayed; REVISIONS, AND ALTERNATIVE SPLICING. isoforms; Name=D;

May play an important role in lymphocytes. certain developing tissues.
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Low level expression seen in normal B and lymphocytes, while a high level expression is seen in activate lymphocytes, and activated monocytes. Also found in the thymus tonsil, bone marrow, developing vessels, and fetal brain.
-!- SIMILARITY: Belongs to the H2.0 homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 [2]

Represses the activity of a Whr.responsive ion factor, LEFI, by stimulating sumoylation and into nuclear bodies. Also interacts with the Cregion of tumor suppressor protein p53 and inhibits p53-ransactivation of target genes BAX and CDKNIA/p21 by RELOCATION: Nuclear.

J. Neurosci. 12:2144-2155(1992).

-I FUNCTION: Adaptins are components of the adaptor complexes w.

Ink clathrin to receptors in coated vesicles. Clathrin-associate protein complexes are believed to interact with the cytoplass tails of membrane proteins, leading to their selection and concentration. Binding of AP180 to clathrin triskella induce:

-!- SUBCELLUIAR LOCATION: Component of the coat surrounding the cytoplasmic face of coated vesicles in the plasma membrane.

-!- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ISOId=061548-2; Sequence=VSP 000172;
TISSUE SPECIFICITY: Brain. Associated with the synapses.
TISSUE SPECIFICITY: Brain. Associated with the synapses.
DEWISDORMINAL STAGE: Developmentally regulated in a pattern
coincident with active synaptogenesis and synaptic maturation
DOWAIN: Possesses a three domain structure: the N-terminal 31
residues harbor a clathrin binding site, an acidic middle dor
450 residues, interrupted by an Ala-rich segment, and the C-
terminal domain (166 residues).
PTM: Phosphorylated.
SIMILARITY: Contains 1 epsin N-terminal homology (ENTH) doma:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi

Adaptions are components of the adaptor complexes which trin to receptors in coated vesicles. Clathrin-associated maplexes are believed to interact with the cytoplasmic membrane proteins, leading to their selection and ion. Binding of API80 to clathrin triskelia induces mbly into 60-70 nM coats.

**R LOCATION: Component of the coat surrounding the cface of coated vesicles in the plasma membrane. chroeder S., Plessmann U., Weber K., Ungewickell E., ably protein AP180: primary structure, domain identification of a clathrin binding site."; PubMed=8440257;

-!- DOMAIN: Possesses a three domain structure: the N-terminal 30 residues harbor a clathrin binding site, an acidic middle dom 450 residues, interrupted by an Ala-rich segment, and the C-terminal domain (166 residues).
-!- PTM: Phosphorylated (By similarity).
-!- SIMILARITY: Contains 1 epsin N-terminal homology (ENTH) domai

-!- FUNCTION: Receptor for both mineralocorticoids (MC) such as aldosterone and glucocorticoids (GC) such as corticosterone cortisol. Binds to mineralocorticoid response elements (MRE) transactivates target genes. The effect of MC is to increase and water transport and thus raise extracellular fluid volume blood pressure and lower potassium levels.

-!- SUBUNIT: Heteromultimeric cytoplasmic complex with HSP90, HSI and FKBP4, in the absence of ligand. After ligand binding, it translocates to the nucleus and binds to DNA as a homodimer a heterodimer with NR3C1. Binds the coactivator NCOA2 (By similarity). May interact with HSD11B2 in the absence of light Binds the coactivator ACOA2 (By Similarity). May interact with HSD11B2 in the absence of light Binds the coactivator NCOA2.

-!- DISEASE: Defects in NR3C2 are a cause of autosomal dominant pseudohypoaldosteronism type I (PHAI) [MIM:17735]. PHAI is characterized by urinary salt wasting, resulting from target unresponsiveness to mineralocorticoids. There are 2 forms of the autosomal dominant form that is mild, and the recessive f

-!- FUNCTION: NOT KNOWN. PROBABLE DNA-REPAIR PROTEIN.
-!- DISEASE: Defects in MSH3 are a cause of susceptibility to endometrial cancer [MIM:608089].
-!- SIMILARITY: Belongs to the DNA mismatch repair muts family.

       Nat. Genet. 14:33-41(1996).

-!- FUNCTION: May represent a chromatin-associated acetyltransfer-
-!- SUBCELLULAR LOCATION: Nuclear.
-!- DISEASE: Involved in acute myeloid leukemias through a chromo
translocation t(8;16)(p11;p13) involving MYST3 and CREBBP.
-!- SIMILARITY: Contains 2 PHD-type zinc fingers.
-!- SIMILARITY: Belongs to the MYST (SARA)(MZ) family.
